

Background

The foster care system currently relies on manual, caseworker-driven matching.

Children have limited or zero input in their placement decisions.

Foster care placements are often driven by availability rather than compatibility. However, by integrating structured child feedback and data-driven matching, we will create stronger placements and long-term outcomes.

Opportunity

Children need a placement process built around compatibility, not availability.

Limited child input

means families are matched before the child's comfort is fully considered.

disruptions

can occur in one year when placements are not stable.

of foster youth experience more than two placements each year.

Solution

WeFosterCare will improve placement stability by shifting decisions from availability-based caseworker matching to child-driven, compatibility-focused placements.

Children actively evaluate and respond to potential families based on comfort and preference

AI-driven recommendations connect children with families based on compatibility, lifestyle, and needs

A placement process begins when both sides show interest, preventing forced or premature placements

Process

Architecture

User Experience

Business Model

Current Competitors:

What makes us different...

Child-Driven Placement Decisions
Comfortable, Unsure, or not comfortable 

Preference-Based Matching
Children and families set preferences, and system generates potential matches for child decision making

Agency Licensing
Agencies pay per user for platform access across teams

Next Step

WeFosterCare will be deployed in a controlled environment to test the matching workflow, and automated coordination

Letting children know they have a bigger voice, especially in deciding where they grow up

Next: Evaluate & Refine
Analyze pilot results, gather caseworker and child feedback to refine the system for wider adoption
